

We can also create immunity against some germs. We give babies vaccines to make them stronger against some illnesses. Complete immunization in time prepare body to fight against germs of certain diseases.

For many germ illnesses, we use medicines. TB, malaria, and leprosy are some illnesses we can cure with medicines.

But some illnesses like hydrophobia; AIDS, etc are without effective cure. These small germs are called viruses. Recently AIDS has some good medicines though no permanent cure is possible.

Think about this

- How can we increase our resistance to illnesses so that we do not fall ill?
- Why we not see the small pox these days?
- Do you come across about hydrophobia patient in your village? Why are people so afraid of a dogbite?
